

Agentic SDLC Accelerator

Move engineering teams from assisted code completion to governed, autonomous delivery workflows — with the guardrails, identity model and evaluation harness that make agentic development safe to run in production.

3–5×

Throughput on well-scoped refactor and migration work

40%

Reduction in code review cycle time across pilot teams

6 wks

From discovery workshop to a governed production pilot

The challenge

Coding assistants have saturated. The next increment is not faster typing — it is delegating whole units of work to agents that plan, execute and verify. Most enterprises stall at exactly that step.

- **No containment model.** Agents run with developer-level credentials and unbounded filesystem and network reach.
- **No non-human identity.** Agent actions are indistinguishable from human ones in the audit trail.
- **No evaluation harness.** Quality is judged anecdotally, so rollout stays stuck in perpetual pilot.

The approach

Phase	Outcome
Discover	Value-stream mapping; agent-suitability scoring per workflow
Contain	Sandboxing tiers, kill switches, prompt-injection defence
Instrument	Eval harness, golden tasks, regression gates in CI
Scale	Root-worker topology, tool governance, cost controls

Architecture at a glance

A root orchestrator decomposes intent and delegates to sandboxed workers. Every tool call is brokered through a gateway that enforces identity, policy and budget — so autonomy scales without surrendering control.

- **Model + harness.** Capability comes from the harness around the model, not the model alone.
- **Two-tier gateway.** Model gateway for tokens and caching; agent gateway for tools, identity and policy.
- **Protocol-native.** MCP for tools, A2A for inter-agent delegation, with security posture defined at both layers.

Why now

Context windows, tool-use reliability and structured planning crossed the threshold where multi-step delegation succeeds often enough to change process design — not just developer ergonomics.

What you get

- Reference architecture and threat model, tailored to your estate
- Working pilot on a real repository — not a sandbox demo
- Evaluation harness and adoption metrics your leadership can track

Start with a half-day discovery workshop

We map your delivery workflows, score them for agent suitability, and leave you with a costed 6-week pilot plan.
